

How To Add Filter To A Webpage

Posted by paul50 - 18 Mar 2012 18:06

Hi Piet,

I'm using Joomla 1.5.25. My websites is redroute parking.com. I'd like to add a filter to the page 'Areas Covered' which can be found in Services-Areas Covered. On that page there are 10 locations. I plan to create several pages for different areas with 10 locations on each page with filters. The idea is to be able to type in an area in the filter box for that area to come up so you don't have to go through all the pages to find it. I also need to be able to create additional pages so people can see page 1 of 20 with a start and end link that goes to the end of the search and back to the beginning. I don't know how to do this and I will be very grateful if you can advise me please. I've tried to use a component called SectionEx but without success as it wouldn't allow me to change the section to uncategorised which is what I've named all my webpages. An example of what I'm trying to achieve can be seen at the following website: www.corepointparkingsolution.co.uk/index...id=15&Itemid=149

Regards

Paul
