Hi, Mr. Piet Nutbey

I am have a hard time with installing Joomla as you do on your video. I have FileZilla and have uploaded my files to my site. I created a folder named joomtorl in the (www) subfolder. But when I go to open a Windows Explorer web browser and type in as you do my [joomtorl.joomtorl.net](http://joomtorl.joomtorl.net) search, I can not get a connection to the installation page of joomla. I only have a starter page at my website location. I am using Windows Vista. Can you give me any insight as to what I am doing wrong.

I am really enjoying the videos, but I just cannot get passed this one step.

Avery Nichols

Hello,

I am not sure what your domainname is, but after your installation throgh FileZilla, you should use: <http://www.yourdomainname.com/joomtorl>

Deriving from message here, yu are using the domainname I used in my sample, which you cannot use yourself

So again, in your case you should use: <http://www.yourdomainname.com/joomtorl>

Where &quot;yourdomainname.com&quot; is replaced by your own real domainname you have.

Hopefully you will succeed and if not, please let me know.
